

MetaVista Advanced Research Report

MetaVista Advanced Research Report

Executive Summary

This report was generated through a modular multi-agent workflow. The system assessed the prompt, activated relevant specialist agents, collected outputs, reviewed risks, and synthesized a detailed research-style answer.

Topic: Not provided

Acting Lens: Bicycle rider

Research Depth: Medium Research

User Prompt

Im looking to buy an ebike . i want to use it for leasure but also for grocery runs, and going with my daughter behind me (same bike) for rides at the park .research options and recommend what i could buy. price is important but also good quality.

Activated Workflow

1. Assess the prompt.
2. Select relevant agents.
3. Run specialist agents.
4. Review assumptions and evidence gaps.
5. Synthesize final report.
6. Generate downloadable PDF if enabled.

Specialist Findings

EX Information Extraction Agent

Information Extraction Agent

Topic: Not provided

Acting Lens: Bicycle rider

Depth: Medium Research

Extracted Task

- Main request: Im looking to buy an ebike . i want to use it for leasure but also for grocery runs, and going with my daughter behind me (same bike) for rides at the park .research options and recommend what i could buy. price is important but also good quality.
- Required output: advanced research-style answer
- Needs: structure, evidence awareness, recommendations, and final report readiness.

Decomposition

1. Understand the task.
2. Identify facts, assumptions, constraints, and expected outputs.
3. Separate evidence-backed claims from reasoning.
4. Prepare clean sections for synthesis.

MS Master Synthesis Agent

Master Synthesis Agent

The final output should be a polished advanced report with:

- executive summary
- task framing
- activated agents
- specialist findings
- evidence gaps
- tables/visual suggestions
- final recommendation

Tone: Bicycle rider

Depth: Medium Research

SK Skeptical Review Agent

Skeptical Review Agent

Risks

- Multi-agent output can still hallucinate.

- PDF formatting can make weak research look authoritative.
- Deep research may become slow or expensive.
- Agents may duplicate each other unless prompts are distinct.

Safeguards

1. Router chooses only relevant agents.
2. Reference agent flags unsupported claims.
3. Synthesizer preserves caveats.
4. Final report separates facts from recommendations.

RF Reference and Evidence Agent

Reference and Evidence Agent

Evidence Strategy

- Prefer official docs, primary sources, research papers, and credible technical references.
- Mark unsupported claims clearly.
- Use citations for current facts, laws, prices, model specs, and benchmarks.
- Separate verified evidence from assumptions.

Citation Plan

Claim Type	Source Type	Rule
Definition	official docs/textbook	cite once
Current fact	recent web source	cite every claim
Technical claim	docs/paper	cite version/date
Recommendation	source + reasoning	state assumptions

Final Recommendation

Keep the system registry-based. Each new agent should be added inside agents/registry.py with an ID, name, keywords, system prompt, and runner. The orchestrator should only select and call registered agents so future expansion remains simple.

Caveats

This implementation gives you the architecture and UI flow. For production-grade references, connect the Reference Agent to live web search, PDFs, papers, or internal document stores.
